

# The Additional Representative Images for Legacy (ARI-L) Development Project

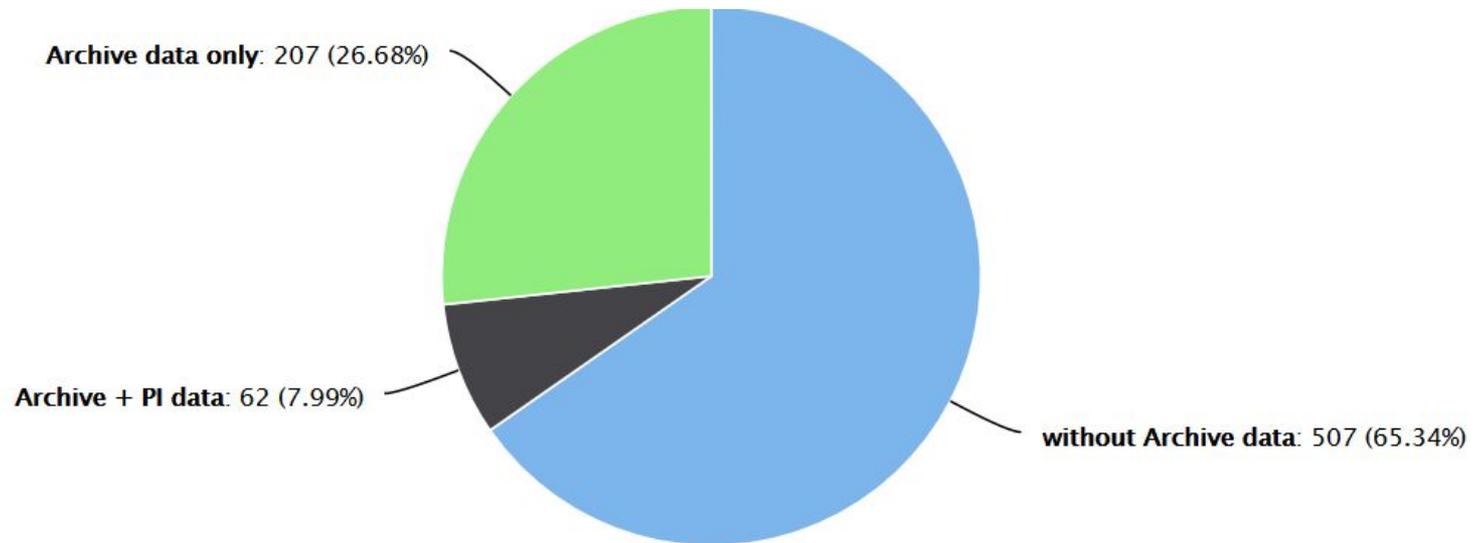

- Exploiting Archives for Radio Astronomy in the SKA-era

15<sup>th</sup> december 2020 - M. Massardi

# THE ALMA Science Archive in the ALMA 2030 roadmap

*...the ALMA Science Archive will become the primary source for an increasing number of publications. The ability to efficiently mine the archive contents is therefore vital for the community and ALMA's future...*

**Mining efficiency affects the science exploitation efficiency**

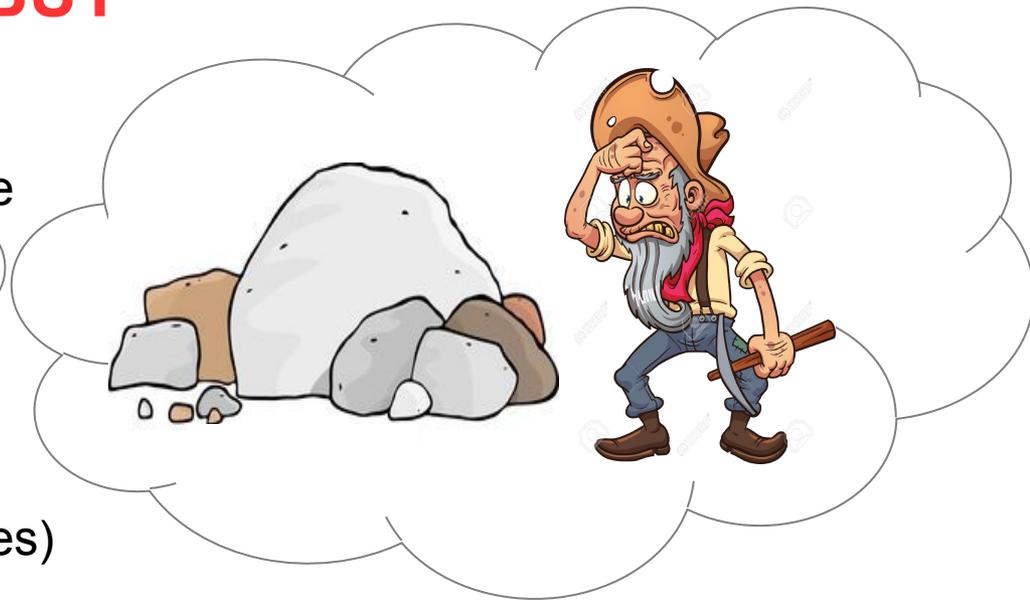

# The ALMA Science Archive from a miner perspective

## THE ASA IS A GOLD MINE

- 3348 projects observed and archived in 8 observing cycles
- data are already calibrated
- not all the possibilities have been exploited
- archive will keep growing

**BUT**

- dataset are big (>100MB in some cases)
- images available are made for quality assurance
  - = incomplete (<10 % in Cy 0-4, better in later cycles, thanks to pipeline)
  - = inhomogeneous across cycles
  - = not easily comparable
- to understand scripts users need interferometry induction/skill (luckily there are the ARC nodes)
- to run scripts CASA is needed (old versions ...)

# The ASA tools need images: ASA previews

process

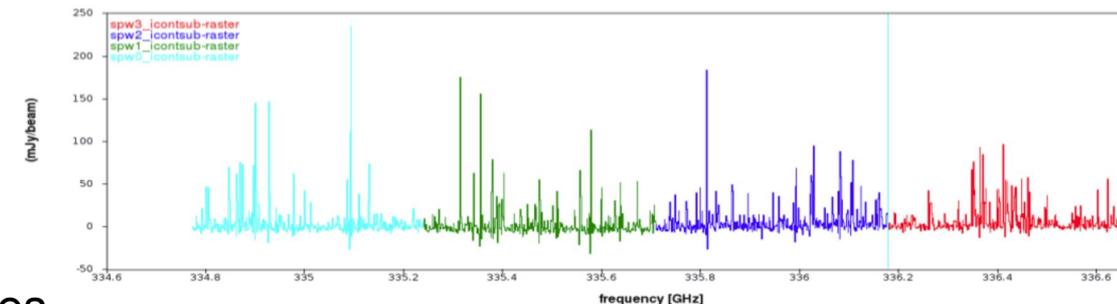

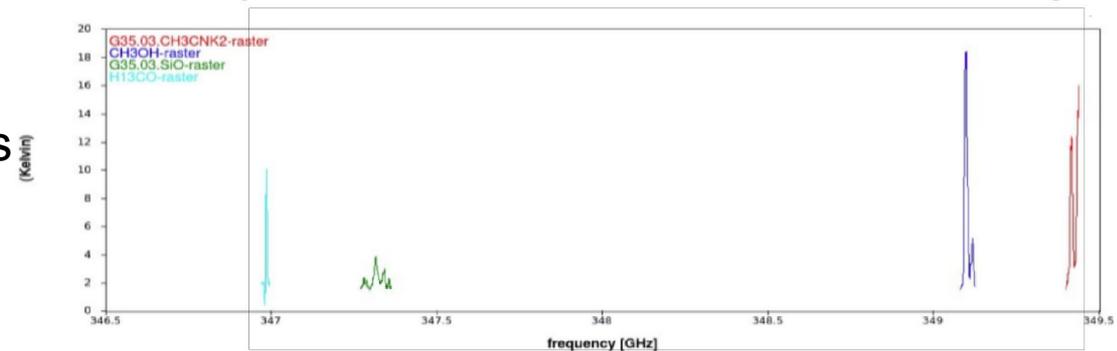

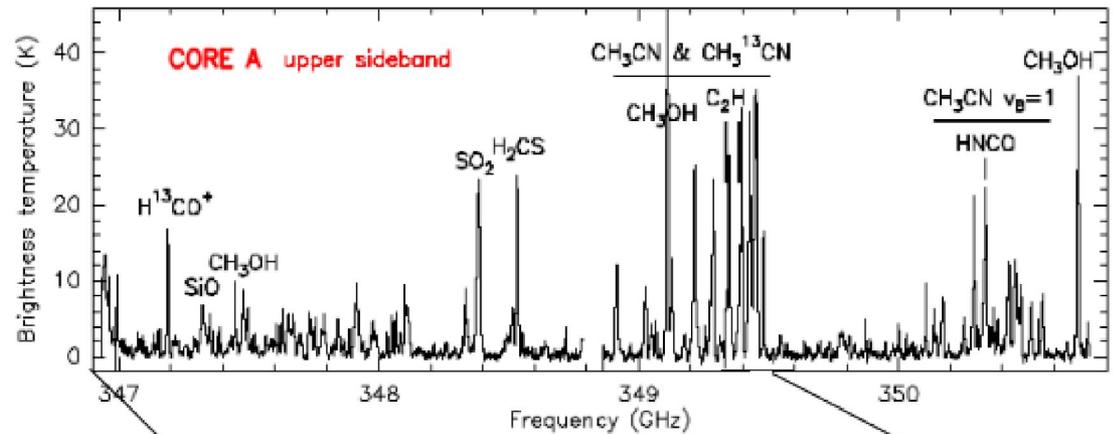

# Science needs images!

Statistical analysis requiring many datasets are impossibly time consuming (see the timeline of J0635-7516, calibrator In hundreds of projects)

Images in the archive are incomplete and Not representative of the data content (see the comparison of published and archived spectra for a pre-stellar object)

Science exploitation need complete, homogeneous, and easily accessible images

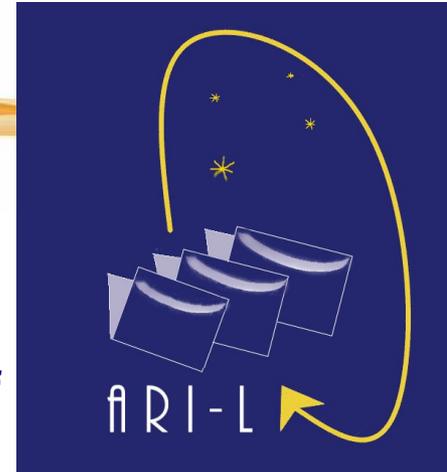

# THE ARI-L DEVELOPMENT PROJECT

The “Additional Representative Images for Legacy (ARI-L) in the ASA” project will produce and ingest into the ASA a set of additional image products representative of the whole data content for more than 70% of the observing projects in cycles 2-4 that can be processed through the ALMA Imaging Pipeline, to complement the QA2-generated images. In addition calibrated MS of the processed dataset will be released too.

The ARI-L philosophy:

- **THINK OF THE MINERS**: we will produce imaging products highly relevant for all science-cases and enhance the possibilities of exploitation of archival data also to non-expert data-miners,
- **HOMOGENEITY** we shall provide a homogeneous view of archive data content within ARI-L and wrt the following Cycles to compare datasets and to make a more conscious download selection,
- **COMPLETENESS** we rate the 70% goal on the number of MOUs but we will try to complete as many projects as possible to complement the ASA resources,
- **ADD VALUE TO THE ASA** we aim at providing additional products that will complement and add value to the ASA, hence we have the responsibility of the quality of what we deliver to be ingested.

# THE ARI-L PROJECT : WORKFLOW

# THE ARI-L PROJECT : WORKFLOW

# THE ARI-L PROJECT : PIPELINE & PRODUCTS

ALMA Pipeline became available for imaging in Cycle 4 (2017).

Later cycles are mostly imaged with the pipeline, but features became more and more efficient with time: not all the datasets were pipelineable.

Earlier cycles were manually imaged.

When introduced, the pipeline was not commissioned to be back compatible, so it can be used with earlier cycles but with care: our study demonstrated the ranges and conditions of applicability and the rate of success for the pipeline applied to earlier cycles (Massardi et al. 2018).

**We, on first attempt, use the same parameters used in later cycles, aiming for homogeneity of the archival products.**

Hence, **like for later cycles we produce in any analyzed MOUS:**

- **1 aggregated continuum image**
- **1 mfs image for each spw**
- **1 cube at the native resolution for each spw**

**for the phase, bandpass and check source calibrator and for each science target** (notice that later cycles products include only continuum for calibrators).

# README

## Additional Representative Images for Legacy (ARI-L) products

###

The ARI-L project products consist of a uniform set of continuum images and native spectral resolution cubes generated with the ALMA Imaging Pipeline for each source included in processable MOUS of cycles 2-4. The project is described in the ARI-L documentation at <https://almascience.org/alma-data/aril>. We stress that these images should be considered indicative of the data content but are not intended to be science-ready.

Information about the content, processing and quality of the data-reduction can be found in the \*weblog.tgz file.

# THE ARIQA

## 3-levels of Quality Assurance:

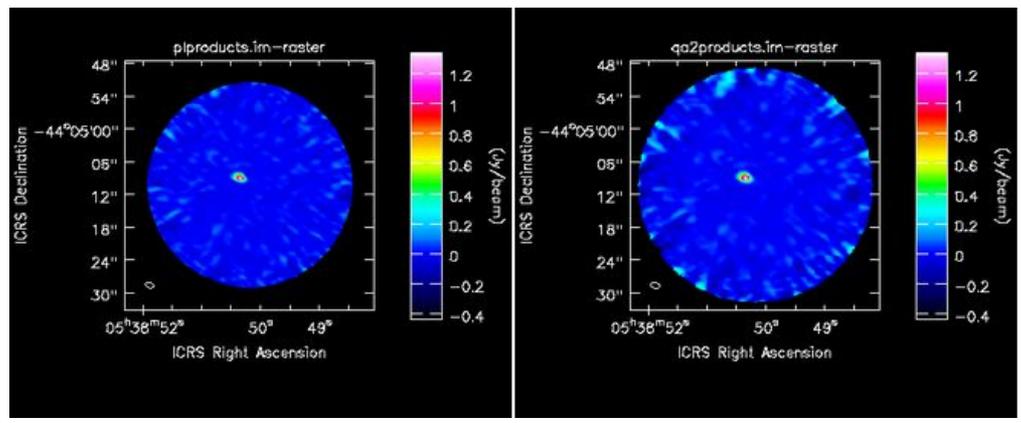

- **check** that the ARI-L code run was performed correctly
- perform a **weblog review** of the imaging pipeline products
- **compare** ARI-L products with QA2 products on rms, peak flux, dynamic range, having extracted the portion of the ARI-L products corresponding to what is available as QA2 products, smooth them to the same resolutions.

About Science Proposing Observing **Data** Processing Tools Documentation Help

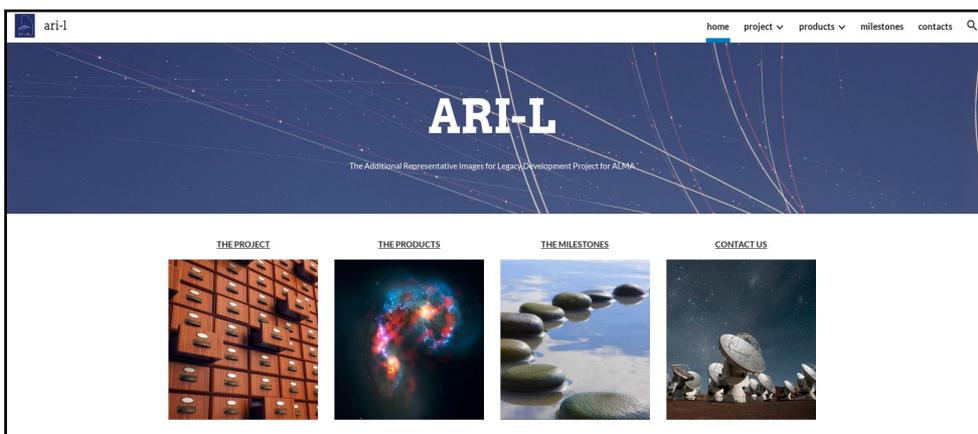

## ARI-L

The **Additional Representative Images for Legacy (ARI-L)** in the ALMA Science Archive (ASA) is an **Development project for ALMA upgrade approved by the ALMA Director in December 2018**. It is based on the results of a feasibility study approved by ESO, as reported in [Massardi et al. \(2019\)](#). The project aims to increase the legacy value of the ALMA Science Archive by bringing the reduction level of ALMA data from Cycles 2-4 close to that of what is processed with the ALMA Imaging Pipeline in more recent Cycles.

The complete set of ARI-L imaging products will be very relevant for all science fields and enhance the possibilities of exploitation of archival data. Indeed, making these images available for all the datasets will:

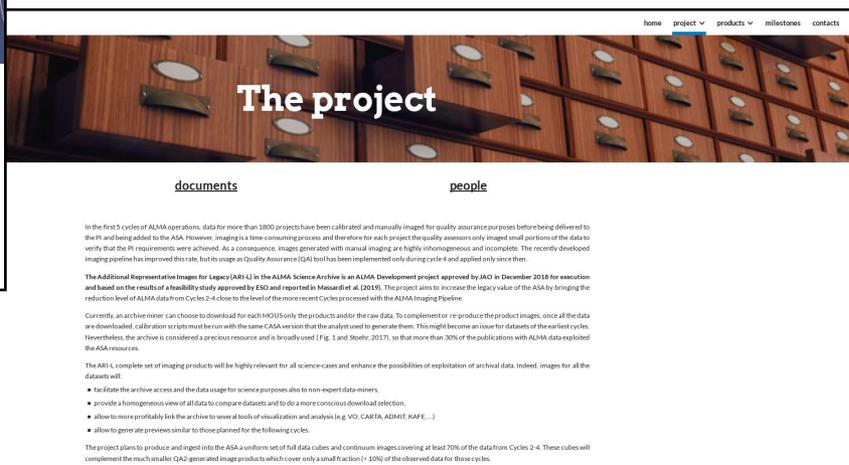

- facilitate archive access and data usage for science purposes, also to non-expert data miners,
- provide a homogeneous view of all data, in order to compare datasets and enable a more conscious download selection,
- permit to more profitably link the archive to several visualisation and analysis tools (e.g. VO, CARTA, ADMIT, KAFE, ...),
- allow users to generate previews similar to those planned for future cycles.

<https://sites.google.com/inaf.it/ari-l>

# DOCUMENTATION: User Guide

## user guide

This page collects the most frequent and relevant user questions related to the ARI-L project.

Additional questions can be submitted via email to [bf@caslab@alma.inaf.it](mailto:bf@caslab@alma.inaf.it)

A pdf version of the user guide is available [here](#).

### Which ALMA dataset may have an ARI-L product?

All the ALMA Cycles 2, 3 and 4 MOUS (with project ID starting with "2012", "2015", "2016") that can be processed with the ALMA imaging pipeline and that have not already been processed during the QA2 stage will be processed with the ARI-L procedures. It is expected that, by the end of the project (in 2022), more than 70 % of them will have an associated ARI-L product folder ingested into the archive.

Currently, the latest version of the imaging pipeline cannot be applied to full Stokes, VLBI, total power, and Solar observational data; MOUS belonging to any of these classes will not have an ARI-L product folder associated. We also do not work with Total Power data.

Only datasets that are stored in the archive and accessible for public download (i.e. not in QA2 or under proprietary restriction during the duration of the project) with the QA2 'passed' or 'semi-passed' flag can be properly calibrated and are included in our project lists.

### How are the products generated?

Each MOUS to be processed with ARI-L is retrieved from the ALMA Archive.

The information needed for the processing (e.g. the CASA version needed for calibration) is retrieved automatically from the downloaded data. Then, for the execution blocks (EBs) of each MOUS, calibration is performed with the proper CASA version using the prescriptions of the calibration scripts included in the downloaded folder. Assuming that the QA2 calibration script generates correct measurement sets, no change or verification is applied to the calibration stage.

The QA2-produced imaging scripts included in the script folder are not used except for extracting meaningful additional flagging commands. This may happen in manual imaging when the QA2 analyst realized that, at the end of the calibration, a portion of the data (i.e. some channels, a time range, an antenna, a baseline, etc.) are still misbehaving with respect to all other data, so the analyst decided to flag the misbehaving data after the calibration but before imaging. Such meaningful commands are extracted and applied in the ARI-L procedure after the calibration and before the imaging.

The most recent version of the pipeline for imaging is then applied to the measurement sets to generate images for each MOUS, combining all the execution blocks belonging to it.

A README file is automatically generated to include a summary of the processed data.

A Quality Assurance step dedicated to the ARI-L product is performed. If passed, the imaging folder is sent to ESO and JAO for ingestion into the archive as external products, while the calibrated measurement sets are stored in the IA2 repository.

### What is the quality of the ARI-L products?

The ARI-L products have a quality that is virtually always comparable to the currently archived products where they overlap. However, the ARI-L products include complete cubes for all the sources in the datasets, while often the QA2 manually imaged products show only a small portion of the images of the representative target.

All the ARI-L products will be quality checked before ingesting them in the archive. The ARI-QA procedure consists of three layers:

- A check will be performed to ensure that the ARI-L code run was performed correctly. In case of failures, ARI-L products (or portion of it) will not be ingested into the ASA.
- The weblog of the imaging pipeline products will be reviewed to verify that the pipeline has properly generated good quality images according to its heuristics (i.e. all the stages have been executed with a score larger than 0.9). Any discrepancy will be analyzed and, if not justified, the relative ARI-L products will not be ingested into the ASA.
- The portion of the data corresponding to what is available as QA2 products will be extracted and smoothed to the same resolutions, and then the rms noise, fluxes, and dynamic ranges will be compared between the products. Differences should be evaluated on the basis of the processes used during QA2, but in case differences are not justified and the

**Massive star formation in O-type young stellar object (G345.49+1.47) (PI: Cesaroni)**

The complete spectral coverage of the ARI-L cubes shows the rich chemistry of this object, useful to investigate the presence of Keplerian disks or outflows and constrain the mechanisms of massive star formation.

Massardi et al. subm.

## Filamentary structure in star forming regions (PI: Kauffmann).

The QA2 images collect only one spectral line for each spectral window (as requested to QA2 analysts to establish the data quality).

The automasking used by the imaging pipeline exploited in ARI-L extracts structure to higher significance with respect to the QA2 image.

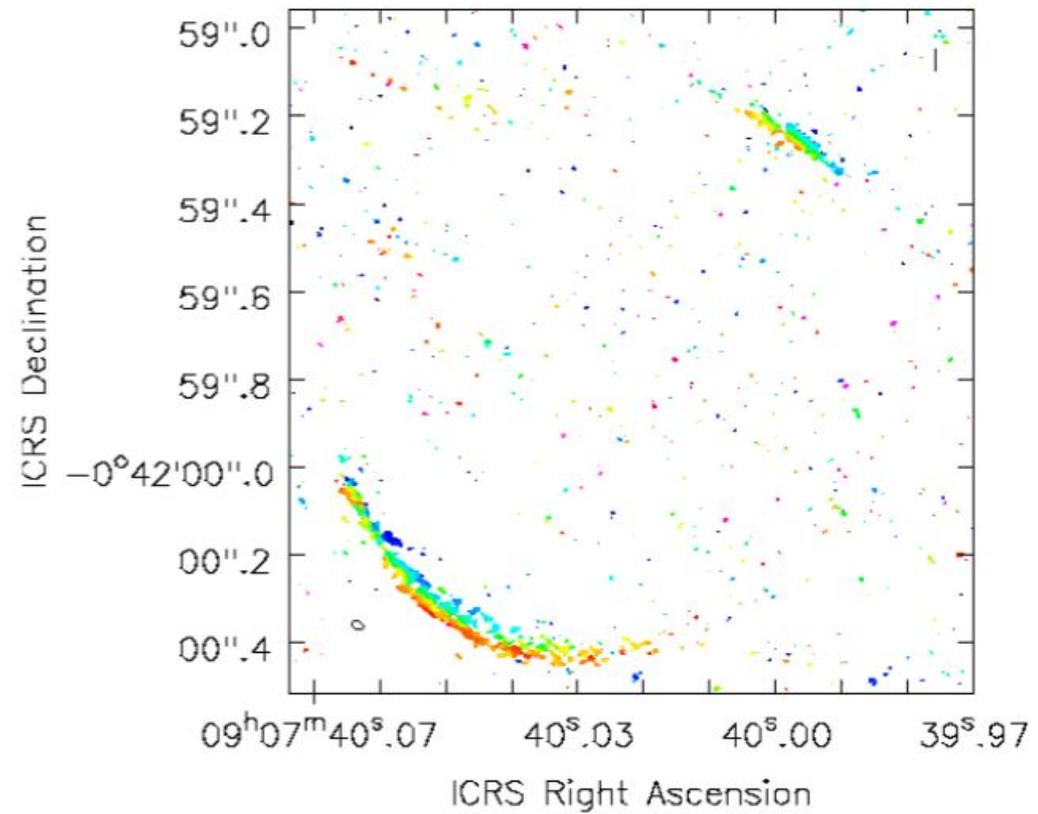

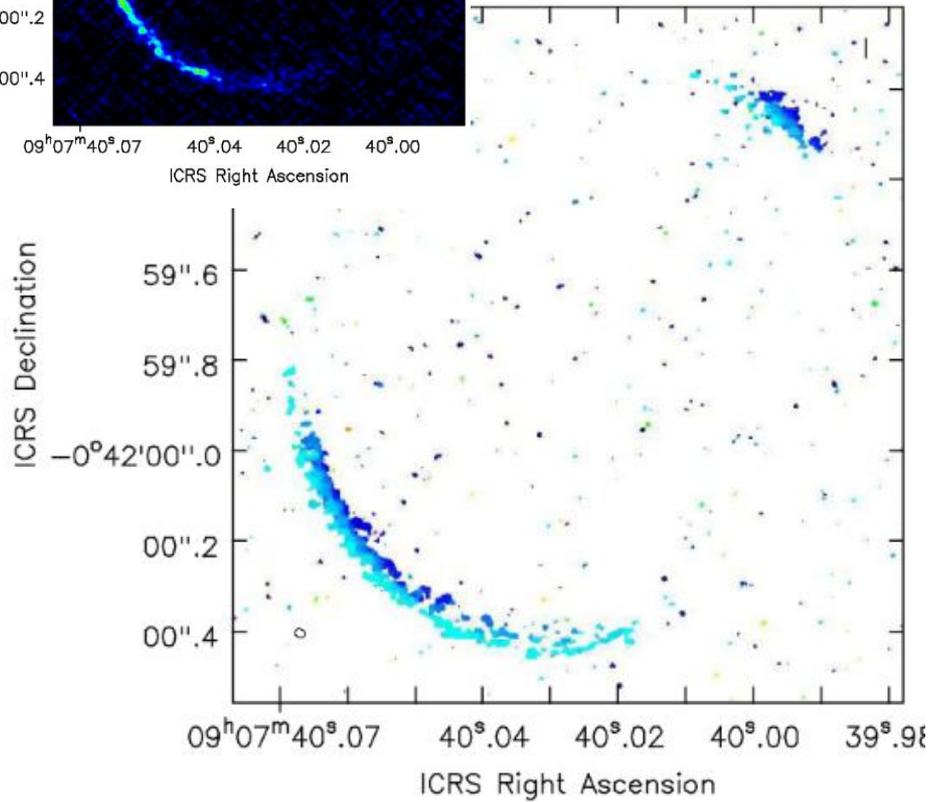

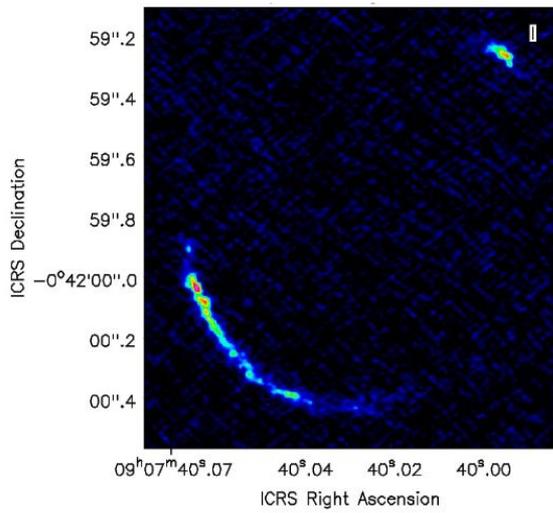

The ARI-L complete spectrum can identify more spectral features that are present in the data.

# SUMMARY

- The project is in full swing!
- Over 1500 MOUS have already successfully been delivered to the ALMA Science Archive
- All delivery milestones have been met (well ahead of time)
- Overall success-rate above the target of 70%
- A dedicated ALMA Science Portal page, a website, and a user guide have been made publicly available
- An ARI-L paper has just been submitted.
